1. Tables

Tables in SAS

Creating Tables

Example SAS syntax to create a table

```
data weight_club;
input IdNumber 1-4 Name $ 6-24 Team $ StartWeight EndWeight;
Loss=StartWeight-EndWeight;
datalines;
1023 David Shaw         red 189 165
1049 Amelia Serrano     yellow 145 124
1219 Alan Nance         red 210 192
1246 Ravi Sinha         yellow 194 177
1078 Ashley McKnight    red 127 118
;
run;
```

`data` keyword is used to define the table name (table names must not contain spaces)

`input` keyword is used to define the column names.

`IdNumber 1-4` is used to state that the characters in position `1-4` of each row would fall under the column `IdNumber` and similarly for `Name $ 6-24`. This eliminates the need of delimiters.

The `$` after `Name` and `Team` indicates that values of the `Name` and `Team` columns are strings.

`Loss=StartWeight-EndWeight` is used to defined a new colum named `Loss` derived from `StartWeight` and `EndWeight`.

`dataline` or `cards` is used to indicate the beginning of the table.

All command lines end with semicolons `;`.

Example of SAS syntax to create a table with missing values

```
data weight_club;
input IdNumber 1-4 Name $ 6-24 Team $ StartWeight EndWeight;
Loss=StartWeight-EndWeight;
cards;
     David Shaw         red 189 165
1049 Amelia Serrano     . 145 124
1219 Alan Nance         red . 192
1246 Ravi Sinha         yellow 194 .
1078 Ashley McKnight    red 127 118
;
run;
```

Classwork 1

```
data company_data;
input Sr_No 1-2 Company $ 4-17 NCI_2021 NCI_2020 NCI_2019 NCI_2018 NCI_2017;
NCI_Avg=(NCI_2021+NCI_2020+NCI_2019+NCI_2018+NCI_2017)/5;
cards;
1  RIL           74257 -143583 -53949 -59109 -54949

;
run;
```

Importing Tables

```
data user_data;
infile "/home/u59242738/Data Files/Uni/DATA_column.txt";
input name $ 1-5 gender $ 6 weight 7-9 dob $ 10-19;
run;
proc print data = user_data;
```

`data` command is used to specify the table name of the imported table.

`infile` is used to specify the file path of the external data.
